

Getting Started: 1Password for IT/Security

You don't compromise on security, and neither do we.

1Password makes the fundamentals of strong security easy so you can create an organizational habit out of great security hygiene.

And with advanced tools for security and IT teams, managing accounts and granular permissions is just as simple.

Advanced tools for IT: Instantly assess security health and automate provisioning

Need an instant, bird's-eye view of security health across the entire organization? Just run a domain breach report – and easily audit the report without administrative access.

Need to automate provisioning and deprovisioning? With the 1Password SCIM Bridge, administrators can invite employees, grant them access to the correct groups, and deprovision them when they leave, all from one place.

IT and Security teams use 1Password to:

- Store API keys to shared server resources
- Store systems architecture diagrams securely
- Separate support teams into tiered access levels with granular permission
- Securely share documents with outside contractors for audit purposes
- Monitor the whole team's access with Advanced Protection

“

1Password is a core component of our IT infrastructure at Wonderbly. It allows each of our teams to securely share information needed to get their work done.
